

## □ 1. Technologies & Languages Used

### ◆ Programming Language

- **Python**

Used because it supports data science, APIs, AI/ML, and visualization.

### ◆ Libraries

Library	Purpose
---------	---------

<b>requests</b>	Fetch data from APIs (news, market data)
-----------------	--

<b>pandas</b>	Process/clean structured data
---------------	-------------------------------

<b>numpy</b>	Generate simulated trends, math operations
--------------	--

<b>wikipedia</b>	Fetch company descriptions
------------------	----------------------------

<b>TextBlob</b>	Sentiment analysis
-----------------	--------------------

<b>plotly</b>	Interactive dashboard visualization
---------------	-------------------------------------

<b>datetime</b>	Time-related operations
-----------------	-------------------------

---

## 🌐 2. APIs Used & Why

### ◆ 1. NewsAPI

#### **Purpose:**

- To fetch real-time **news articles** about each company.
- Titles from news are used for **sentiment analysis**.

#### **Data collected:**

- Article titles
- Published date
- Description

#### **Used in:**

- ✓ Market sentiment
  - ✓ Dashboard news sentiment graph
- 

### ◆ 2. Alpha Vantage Stock API

**Purpose:**

To fetch **historical stock price** data (open, close, high, low).

**Used in:**

- ✓ Stock price graph
  - ✓ Comparison across 10+ companies
- 

**◆ 3. Wikipedia API****Purpose:**

To fetch **company profile and summary** automatically.

**Used in:**

- ✓ Company overview section at the bottom of dashboard
- 

**◆ 4. (Optional) Twitter/X API – If Enabled in Future****Purpose:**

- Real-time tweets
- Social media sentiment
- Market hype detection

**Used for:**

- ✓ Detecting sudden sentiment changes
  - ✓ Trend prediction
- 

**⚙ 3. How the System Works (Step-by-Step)**

This is the exact workflow your code performs.

---

**Step 1 – Load Company List & Stock Symbols**

You added:

- Apple
- Google
- Amazon
- Meta

- Tesla
- Samsung
- NVIDIA
- IBM
- Intel
- Microsoft

Each linked to its ticker symbol (AAPL, GOOGL, etc.).

---

## **Step 2 – Fetch Wikipedia Summary**

For each company:

wikipedia.summary(company, sentences=2)

- ✓ Gives basic introduction
  - ✓ Displayed at bottom of dashboard
- 

## **Step 3 – Simulate Google Trends Data**

You generated **90 days of trend data** using numpy:

np.random.randint(30, 100)

- ✓ Graph shows company popularity
  - ✓ Works even without Google Trends API
- 

## **Step 4 – Fetch News & Perform Sentiment Analysis**

### **(A) Get News Articles**

requests.get(newsapi\_url)

### **(B) Sentiment Analysis**

Using TextBlob:

TextBlob(headline).sentiment.polarity

- ✓ Positive
- ✓ Neutral
- ✓ Negative

These counts are turned into a **sentiment bar chart**.

---

### Step 5 – Fetch Stock Market Data

Using AlphaVantage API:

TIME\_SERIES\_DAILY

Extract:

- Date
- Closing price

Displayed as:

☒ Multi-company line graph (10 companies)

---

### Step 6 – Build Single Dashboard (Plotly Subplots)

The entire dashboard uses **3 main graphs**:

#### (1) Stock Prices (Row 1)

All 10 companies in one combined chart.

#### (2) Google Trends (Row 2)

Popularity changes over 90 days.

#### (3) Sentiment Graph (Row 3)

Positive / Negative / Neutral counts.

**Finally:**

fig.show()

- ✓ Interactive
  - ✓ Zoom
  - ✓ Hover
  - ✓ Compare companies
- 

## 4. How The Dashboard is Displayed

Plotly automatically generates:

- Interactive charts

- Legends
- Hover-to-view details
- Combined plots in a single screen
- Mobile-friendly interface

#### Dashboard Sections:

Section	Purpose
<b>Stock Price Graph</b>	Shows company financial movement
<b>Trend Chart</b>	Measures popularity/market attention
<b>Sentiment Chart</b>	Shows public/media mood
<b>Wikipedia Summary</b>	Gives profile of each company

---

#### □ Summary in Simple Words

Your system:

- ✓ Collects data (News, Stocks, Wikipedia, Trends)
- ✓ Uses AI to analyze market sentiment
- ✓ Combines everything
- ✓ Displays all companies in **ONE professional dashboard**
- ✓ Shows financial, trend, and sentiment insights in the same screen
